

Web-based Geospatial Database to Support Environmental Regeneration in Brent River Park

Project Purpose

This project will develop an **integrated, web-based geospatial database** to improve how Brent River Park is understood, monitored and supported by community and institutional stakeholders. The system will combine **remote sensing datasets** with **in-situ environmental and weather-related measurements** using **open-source geospatial tools** and **scalable database structures**.

Expected Outcome

Environmental
monitoring

Regeneration
planning

Community
stewardship

Evidence-based
decision making

What the platform will provide

Data Integration

Remote sensing imagery, environmental indicators, land use data, council-provided or public datasets, and in situ weather-related observations.

Technical Approach

Open-source tools such as QGIS, with lightweight relational database structures like PostGIS or SQLite, for scalable web dissemination

Interactive Outputs

Usable map layers for biodiversity, footpaths, water quality, vegetation and environmental risk indicators

End Users

Community organisations, local authorities, environmental groups, residents, volunteers and university partners
